

ADDING DISK STORAGE TO THE PROTECTED THEATER

If the disk storage you initially configured for your Protected Theater is no longer adequate, you can mount an additional drive.

To mount an additional drive:

1. Move/remove the current images directory

- a. Remove, nothing to save:

```
rm -fR /opt/apps/verodin/node/images
```

Typos in this command could damage the platform.

- b. Move information

```
mv /opt/apps/verodin/node/images </target/folder>
```

2. Create a symlink back to the expected images folder location

```
ln -s /target/folder/images /opt/apps/verodin/node/images
```

If you need more information or specific steps to complete the creation of virtual disks on Linux, see the vmware knowledgebase, <https://kb.vmware.com/s/article/1003940>.
