

AUTHENTICATION SETTINGS

The Security Validation Director can be integrated with other systems for authentication. By default, the Director is set for local authentication. However, you can configure the Director to use one of several systems for authentication:

- **Using Active Directory for Authentication** (<https://docs.mandiant.com/home/msv-active-directory-authentication>)
- **Using Active Directory and Google Authenticator for Authentication** (<https://docs.mandiant.com/home/msv-active-directory-and-google-authenticator-authentication>)
- **Using Google Authenticator for Authentication** (<https://docs.mandiant.com/home/msv-google-authenticator-authentication>)
- **Using SAML for Authentication** (<https://docs.mandiant.com/home/msv-saml-authentication>)

IMPORTANT: Authentication integrations are only for authentication - User permissions still needed to be defined in the Validation Platform.
