

THIRD PARTY MONITORING WORKFLOW

The Third Party Monitoring Workflow in Mandiant Advantage Attack Surface Management (MA-ASM) provides you with read-only access to three third-party Collections from the MA-ASM Catalogue. The Catalogue is a repository of third-party Collections gathered through open source intelligence (OSINT) discovery methods. You can use the Catalogue to monitor alerts and vulnerabilities that have been identified by vendors you interact with.

Here are some helpful hints to keep in mind when using the Third Party Monitoring Workflow:

- One Collection is created for each third-party Collection you choose to follow from the Catalogue.
- You can only follow a specific third-party Collection once. In the Third Party Monitoring Workflow, when you search the Catalogue for a Collection you already follow, you see a note that it's **Already added**.
- If you want to unfollow a third-party Collection, you must archive your Collection that contains that third-party Collection.
- You can only follow up to three third-party Collections at a time. For example, if you are currently following three third-party Collections and want to change any of those Collections, you can archive one or more of them. This allows you to add new third-party Collections, provided you do not exceed the maximum of three.

Create a Collection for Third Party Monitoring

1. In MA-ASM, select **Settings** from the **Collections** menu.
2. Click **+ Create New Collection**.
3. Select **Third Party Monitoring**.
4. Click **I Accept** to accept the **Catalogue Acknowledgement**.
5. Search for Collections and click **Add Catalogue** for any you want to follow.
6. Click **Create Collection**.

If you add more than one Catalogue, the number of Collections created is equal to the number of Catalogues you add.

Two Read-Only Third Party Collections, known as Catalogues, are selected in the Third Party Monitoring Workflow setup
