

APRIL 17, 2024 MANDIANT ADVANTAGE THREAT INTELLIGENCE RELEASE

New Version

Digital Threat Monitoring (DTM) API v0.1.325

New in this Release

- Compromised Credential domains are normalized (lowercased and deduplicated). In addition, existing Compromised Credential monitors and verified domains are normalized as part of the release, where applicable. If a monitor is normalized as part of this process, the domains are updated, but it retains the same matching behavior.
- Bad API requests are rate limited to at most 100 per hour per user. A bad API request is an API response code greater than or equal to 400.

Bug Fixes

- Email recipient status no longer incorrectly gets set to "pending" when the list of email recipients gets updated.
- Users can correctly export a Compromised Credentials bucket with over 10,000 alerts.
